

Normal Flow :

Demo.java --> compiler --> Demo.class --> JVM --> output

Order.java
User.java
Payment.java
...
...

Order.class
User.class
Payment.class
...
...

ZIP

images
properties

JAR --> Java Archives --> Package.

1. Multiple class files
2. Resources (images / properties)
3. Folders/packages

1. To share your java code easily.

calculator.jar

Library

Application

2. To use external libraries (mysql-connector.jar)

What is Maven ?

Project Management Tool

1. Folder structure
2. Compile code
3. Creates JAR code
4. Dependices download (JAR)

pom.xml (Project Object Model)

super pom --> parent of al pom

effective pom --> maven finally uses this. (pom + super pom)

Maven uses 2 Repositories :

Maven Central

Local --> .m2/repositories

Other remote

Complete flow :

1. Maven read pom.xml
2. check Local Repo(m2/repository)
3. check Maven Central Repo
4. Store downloaded jar in local

Life Cycle :

1. clean lifecycle (clean)

2. Default lifecycle

validate -> compile -> test -> package
-> verify -> install -> deploy

3. Site lifecycle (site)

/Users/{yourName}/.m2/repository
/org/example/MavenDemo/1.0-SNAPSHOT/
MavenDemo-1.0-SNAPSHOT.jar
